

Keep our fish and waterways healthy

Make 'Clean' part of your routine

Check and clean your shoes, fishing equipment, boats and trailers when moving between NSW waterways to help reduce the risk of transporting aquatic pests and diseases to where they don't belong.

Checklist when fishing:

- Always check, clean and dry your fishing rod and gear between waterways
- Don't transfer fish between waterways or collect bait from one area and use it in another
- Don't return pest fish to the water – if you catch a pest fish please dispose of it appropriately away from the water

Choose the right bait, mate!

Help keep unwanted diseases out of NSW waters by using bait that has been locally caught or locally bought - don't use seafood from the supermarket - that's for you to eat only!

Unwanted in NSW, White Spot Disease, caused by a virus that affects crustaceans, like prawns, crabs, lobsters and yabbies. It poses no threat to human health or food safety but can infect prawn farms and impact on our natural waterways.

Be a Biosecurity Warrior and learn what you can do to help stop the spread of aquatic disease and pests
