

# A Quest for (Sustainable) Yield

**Richard Trethowan**

The Plant Breeding Institute  
School of Life and Environmental Sciences  
The Sydney Institute of Agriculture

THE UNIVERSITY OF  
**SYDNEY**

# The aims of wheat breeding: not much has changed

**1903:** Farrer aimed to “create a wheat variety that was resistant to black rust, grew well in Australia's hot and dry climate and made excellent flour”.

**1988:** Make wheat growing **profitable** through improved yield, disease resistance and market quality

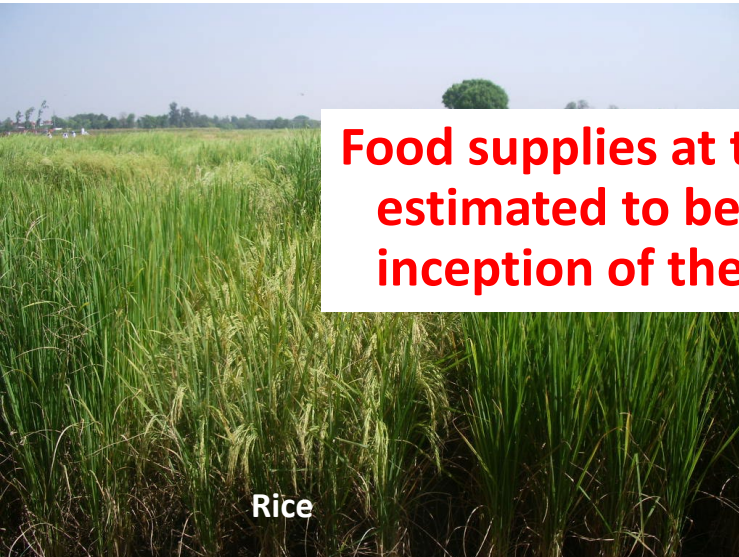

**2023:** Make wheat growing profitable and **sustainable** through higher yield, better disease resistance, **improved resource-use efficiency** and appropriate market quality **in a changing climate**

# The Green Revolution (1966 – 1995)

New genetics (short statured wheat and rice) and improved agronomy to significantly increased crop yields

- Cereal production doubled in Asia (1970 – 1995)
- Population increased by 60% at the same time

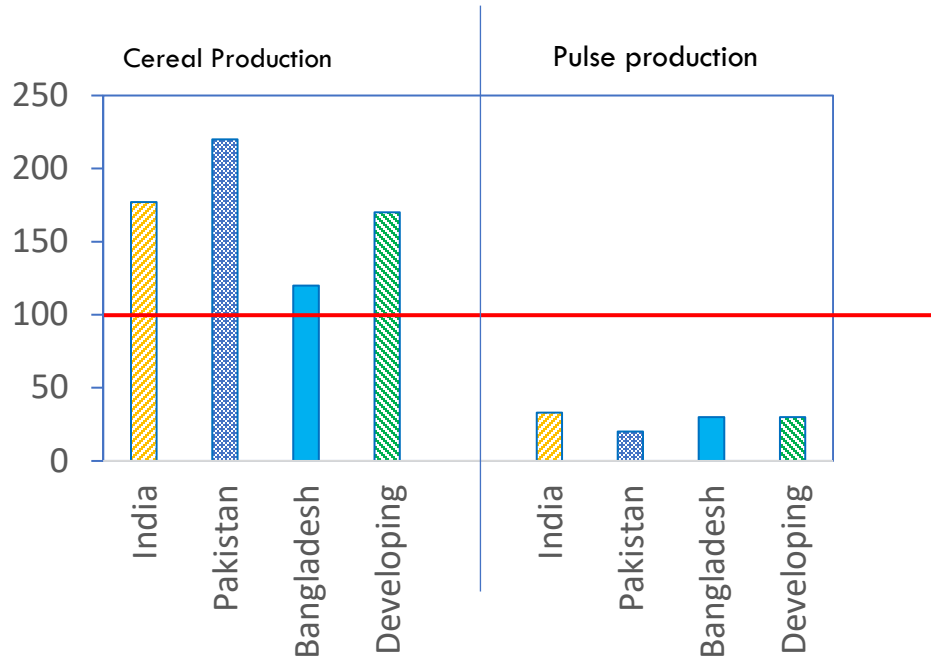

Rice

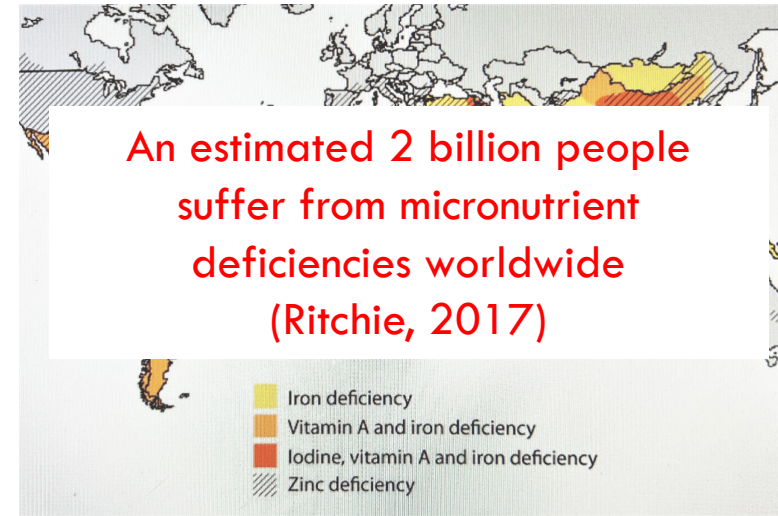

**Food supplies at the end of the 20<sup>th</sup> century were estimated to be 25% higher per person than at the inception of the Green Revolution (Davies, 2003)**

# Unintended consequences of the Green Revolution

Percent change in cereal and pulse production: 1965 – 1999  
(FAO, 1999)

Distribution of micronutrient deficiency (Knez and Graham, 2013)

# The Green Revolution has run out of steam

## Trends in global and Australian wheat yield (1980 – 2022)

Both the stability and productivity of wheat must improve in our increasingly hostile farming environment

# Crop breeding in a changing climate:

**Genetics** x Management x Environment x Market

1. Increasing potential yield
2. Protecting yield
3. Enhancing dietary value

# 1. Increasing potential yield:

## Hybrid vigour

2017)  
University of  
Sydney academic,  
cytogeneticist  
and plant breeder

# What is hybrid wheat?

- First generation progeny from a cross between two in bred lines
- Benefits of hybrid vigour well known
- Limitations of self-pollination

# Benefits of hybrid vigour

Hybrid maize revolutionized  
production globally

Source: FAOSTAT

## Our innovation (blue aleurone system)

- Genetic
- Natural diversity
- No chemicals
- Easy to use (all pollen donors restore fertility)
- Complete sterility/restoration
- Patented
- Molecular tags for all components (sterility, fertility restoration, seed colour)

Blue and white seed  
segregate on the  
same plant

Blue seed is fertile and  
kept to maintain the  
genetic system

White seed is male sterile and  
used to produce female plants  
for hybrid seed production

## Hybrid seed production

Female

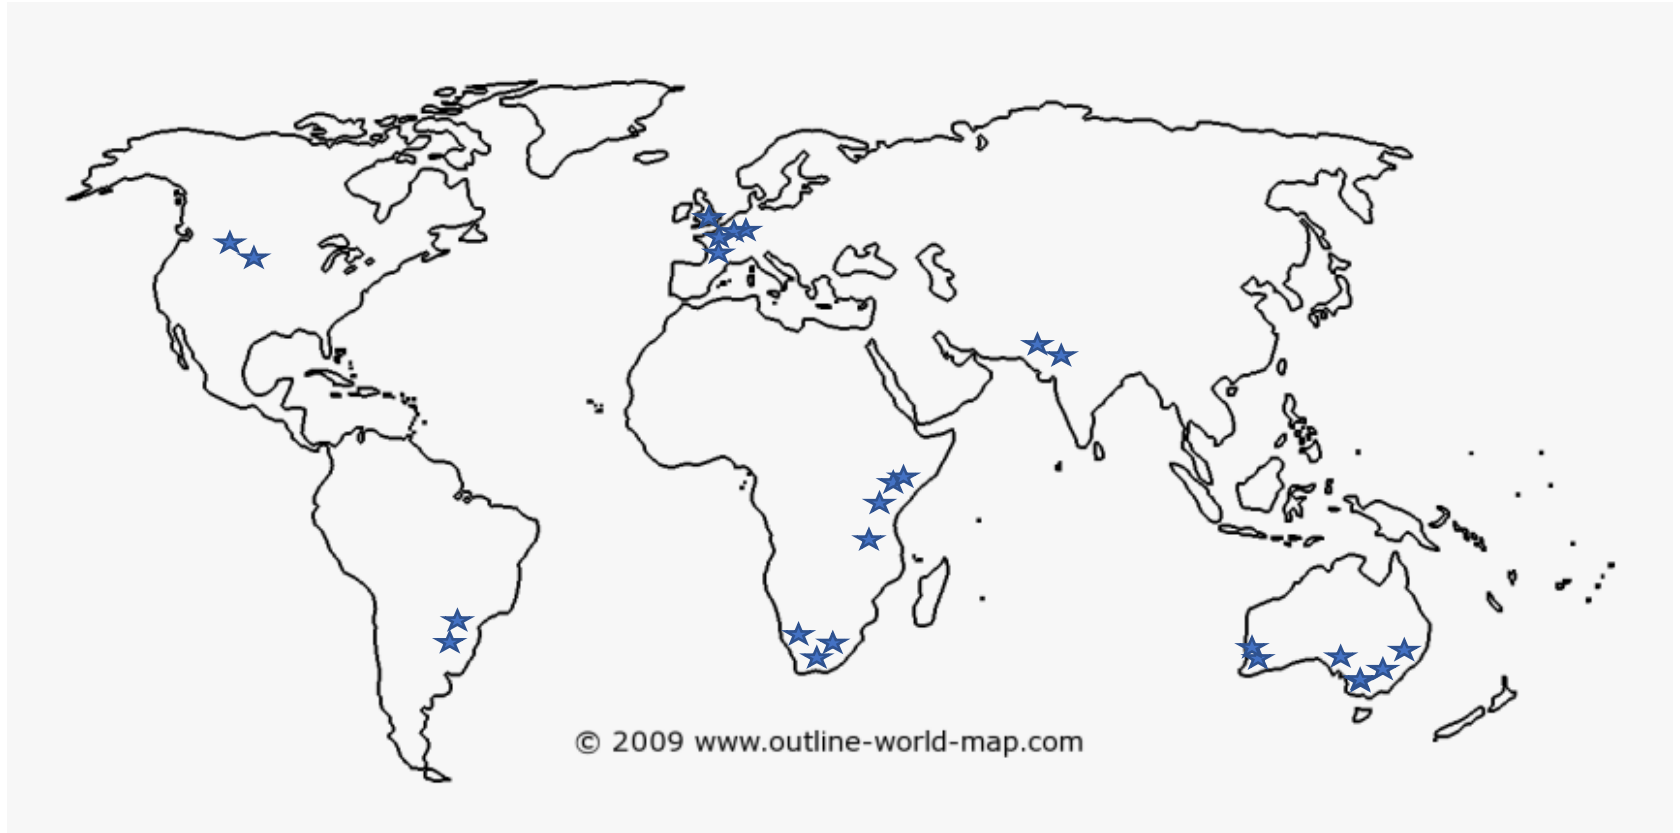

Male

Female

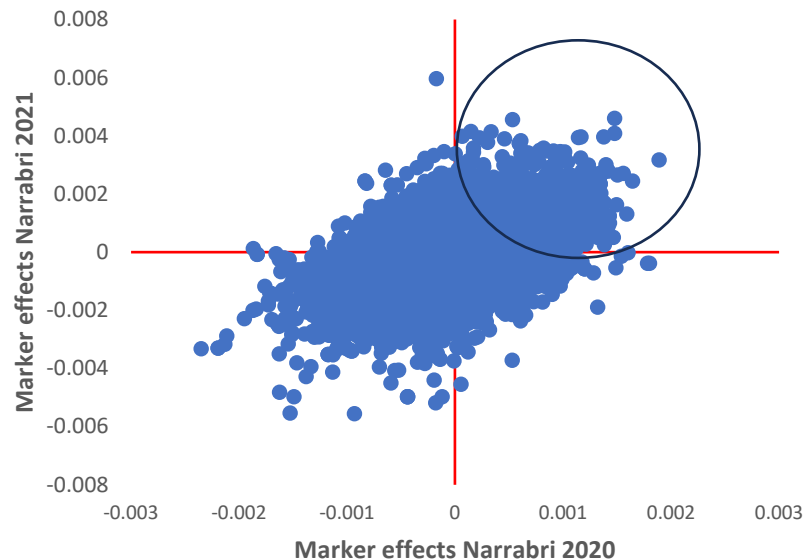

# Identifying heterotic pools to maximize heterosis

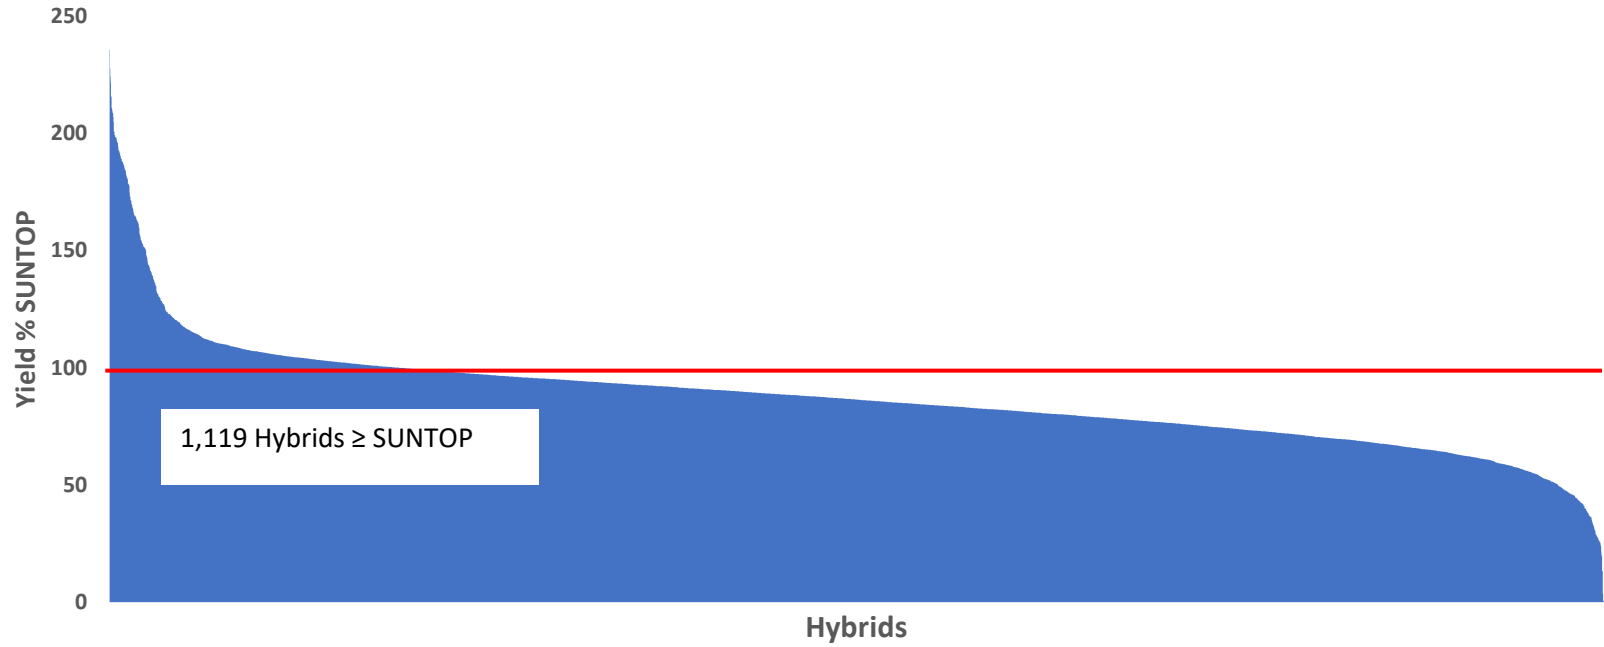

# Marker effects for yield at Narrabri and Kenya

# 5,776 comparisons of F1 hybrid yield and SUNTOP across 58 environments and 7 years

## 2. Protecting yield:

### High temperature tolerance

# Accurate and relevant high temperature screening

## A four-tiered strategy

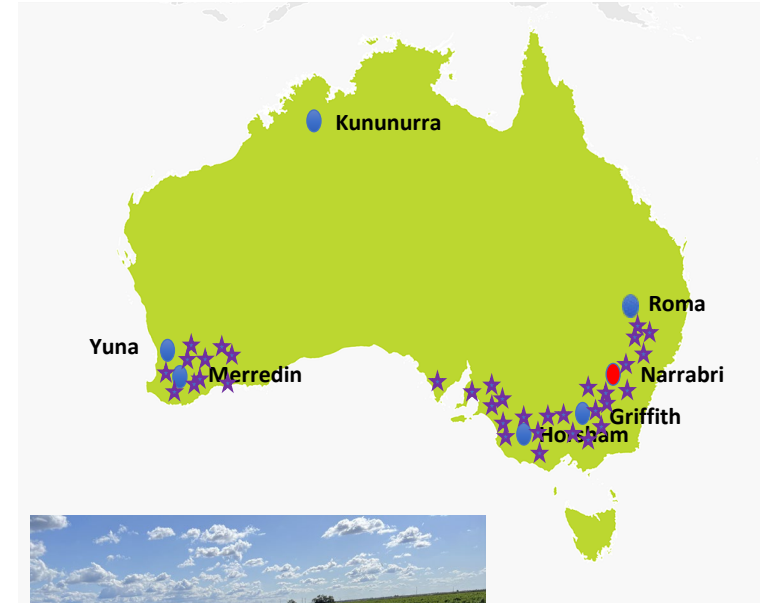

**Step 1.** Large numbers of lines replicated in time of sowing field experiments

- Intensive phenotyping & genotyping
- Genomic estimated breeding values (GEBVs) calculated
- Subsets sown at key locations (diversity & GEBVs)

**Step 2.** Heat tolerance then confirmed using in-field heat chambers

**Step 3.** Reproductive heat tolerance confirmed in the glasshouse

**Step 4.** Heat tolerant lines evaluated at >35 locations nationally

# In season phenotyping

Phenology  
Plant height  
NDVI (greenness/biomass)  
Canopy temperature  
Disease incidence

## Thermal imagery

- Flying height of 60 m
- Ground pixel resolution of 8 cm
- Data processed into means and standard errors

An aerial photograph of a cornfield during harvest. The field is divided into numerous rectangular plots, each containing a different variety of corn. The plants are in various stages of maturity, with some showing golden-brown ears and others still green. A green combine harvester is visible in the upper right quadrant, moving through the rows of corn. The overall scene is a mosaic of different colors and textures, representing a diverse genetic population.

Genomic estimated breeding values calculated using a weighted index  
for selection

Harvest Plus

Grains Research and Development Corporation

# Most current research focuses on increasing Fe and Zn concentration

Fe and Zn are generally located in the seed coat

- Wheat in much of the developing world consumed as whole grain although trends changing in both developing and developed countries
- biological limitations to increasing Fe and Zn concentration and grain yield
- similar limitation for all nutrients associated with bran

# Wheat breeding targets for Fe and Zn

## Zn targets

Baseline = 25 mg/kg

Target = 33 mg/kg (+ 8 mg/kg)

(bioavailability of cereal sources in humans is 15%)

## Fe targets

Baseline = 30 mg/kg

Target = 48 mg/kg (+ 18 mg/kg)

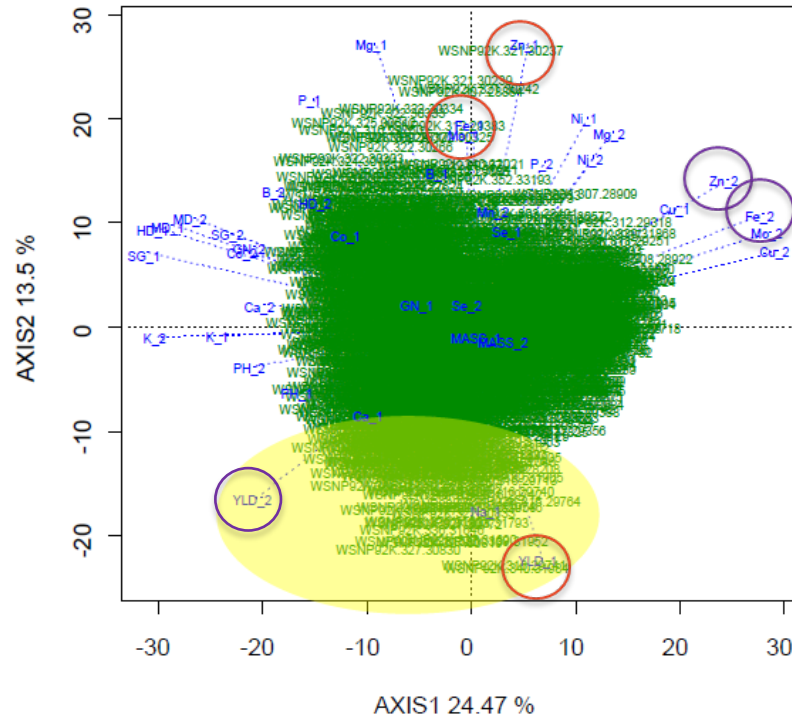

(bioavailability of cereal sources in humans is 10%)

*Source: Harvest Plus*

- Established in 2004
- 40 zinc enriched cultivars have been released in India, Pakistan, Bangladesh, Nepal, and Bolivia.

## Yield and micronutrients of 3,000 wheat lines in two environments in NSW

# Enhancing bioavailability of key nutrients

Phytate forms complexes with dietary minerals, especially iron and zinc, and causes mineral-related deficiency in humans

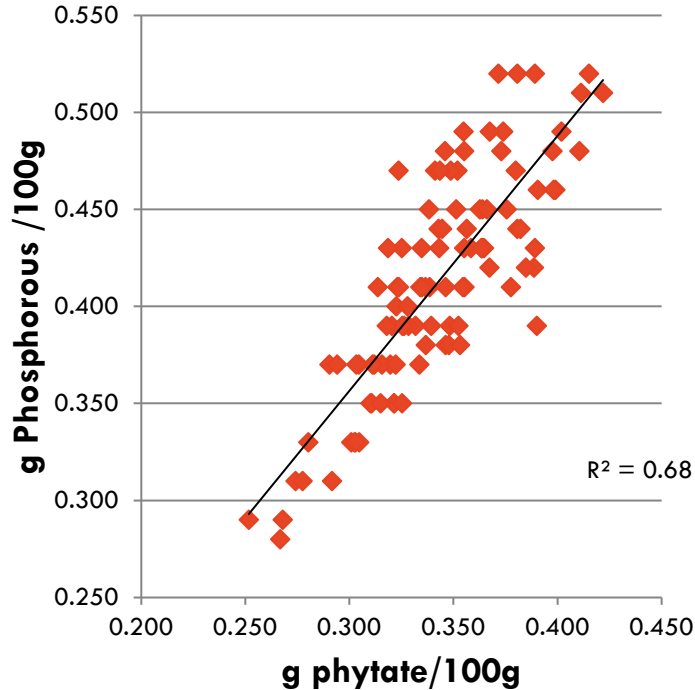

*(Kumar et al. 2010, Food Chemistry).*

Baseline: 0.35g/100g in wheat whole meal flour

Target: ( $\leq$  0.2g/100g)

(too low can reduce seed germination)

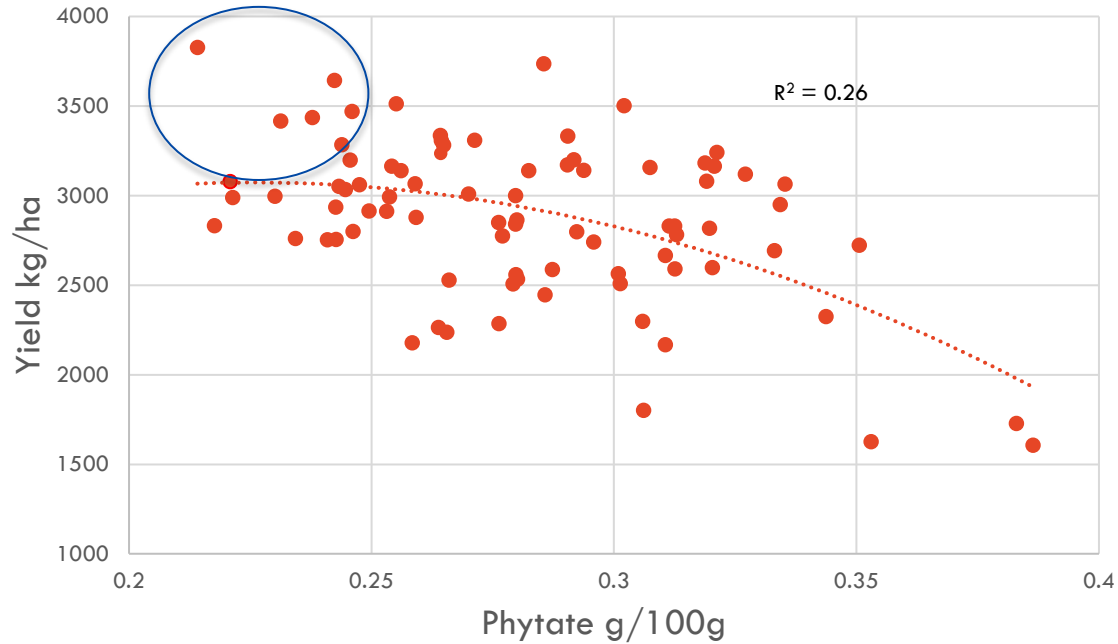

## Relationship between phytate and total grain P

- › Low phytate lines tend to have lower total P
- › Inferences for P-use efficiency: less P is removed at harvest with low phytate lines.

# Phytates and grain yield

# Influence of wheat diet on broiler growth

Broilers fed both diets in a feeding trial and assessed at 14 days age

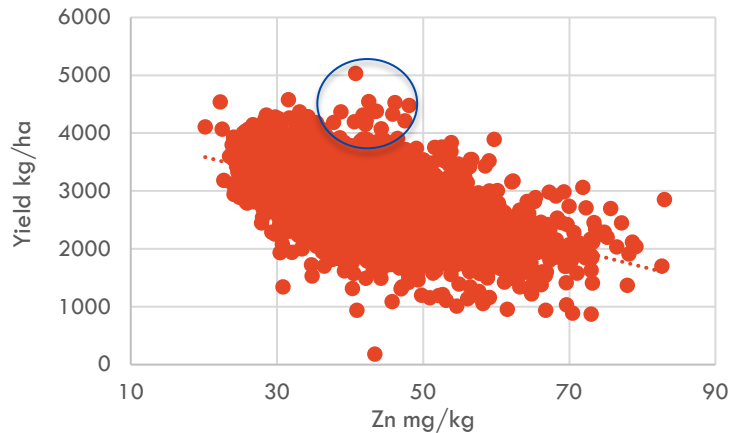

- Low phytate increased food intake by 7%
- Low phytate increased body weight gain by 9%

Wheat line	Phytate
IDO 637/IRS 812.9 - 10	Average
IDO 637/IRS 812.9 - 24	Low

## High-yielding and nutritious wheat is possible with:

- Lower phytate (30% reduction)
- Intermediate Fe and Zn concentration (~10% under target)

# What will future wheat be like?

“A hybrid with enhanced yield that is buffered by superior abiotic and biotic stress tolerance, that requires fewer inputs and produces a more nutritious grain”
