NSW Estuary General Fishery Non-collapsible Discard Chute Guidelines (for use in NSW Estuarine Waters)

Guidelines:

1. The chute must be firmly attached to the boat when releasing fish.
2. The chute must have an internal diameter not less than 250 mm.
3. The chute must have no less than two (2) holes with a diameter not less than 20 mm in the section of the chute that is submerged when releasing fish.
4. Not less than 400 mm of the chute must be submerged in the water when releasing fish. If the depth of the water to which fish are being released is less than 400 mm the chute must be submerged deep enough to ensure that fish are released below the water's surface.
5. A species of fish may be released without using a discard chute if the release of that species of fish using the discard chute is likely to harm or otherwise injure the fisher releasing the fish.
