1. PURPOSE

The purpose of this Procedure is to describe:
(a) the operation and principles; and
(b) the responsibilities and actions of personnel;
that applies to the pre-harvest treatment and post-harvest inspection of approved host produce for Queensland Fruit Fly (QFF) under an Interstate Certification Assurance (ICA) arrangement.

2. SCOPE

This Procedure covers all certification of pre-harvest treatment and inspection of approved host produce from a Business operating under an ICA arrangement in New South Wales.

This Procedure is applicable where the requirements specified in section 6 are a specified condition of entry of an interstate quarantine authority for QFF.

Pest: Queensland fruit fly (QFF)
Produce: Blueberries, persimmons, pome and stonefruit.
Location: This Procedure is separated into two sections:
- Part A covering grower activities, and
- Part B covering packer activities.

IMPORTANT

Suspension of Dimethoate and Fenthion

The Australian Pesticides and Veterinary Medicines Authority (APVMA) have suspended certain use patterns for Dimethoate and Fenthion. Treatment of some host produce previously eligible for treatment are no longer permitted. Check the APVMA website at www.apvma.gov.au for further details.

ALWAYS READ THE LABEL

Users of agricultural (or veterinary) chemical products must always read the label and any Permit before using the product and strictly comply with the directions on the label and the conditions of any Permit. Users are not absolved from compliance with the directions of the label or the conditions of the Permit by reason of any statement made or omitted to be made in this Procedure.

Certification of fruit fly host produce under this Procedure may not be an accepted quarantine entry condition for all produce to all intrastate and interstate markets.

Some intrastate or interstate markets may require additional plant health certification for pests and diseases other than fruit fly as a condition of entry.

It is the responsibility of the Business consigning the produce to ensure compliance with all applicable quarantine requirements.

Information on intrastate and interstate quarantine requirements can be obtained by phoning 1800 084 881 or accessing http://www.interstatequarantine.org.au/.

3. REFERENCES

Biosecurity Act 2015

4. DEFINITIONS

In this Procedure:

Act
means the Biosecurity Act 2015.

APVMA
means the Australian Pesticides and Veterinary Medicines Authority.

Authorised Person
means an authorised officer under the Act or a person authorised under a law of another State or Territory that relates to plant biosecurity.

Authorised Signatory
means a person whose name is notified to the Secretary as a person who can issue a biosecurity certificate on behalf of the business.

block
means an identifiable area of land on which produce is grown and pre-harvest treated as a unit and that is detailed on the Property Plan.

blueberries
means all commercial varieties of Vaccinium spp.

Business
means the legal entity accredited as a biosecurity certifier under the Act.

Certification Assurance Arrangement
means a CA Arrangement that enables a business or a person authorised under a corresponding law of a State or Territory, to issue a Plant Health Assurance Certificate that meets certain plant health quarantine conditions for trade within the State or between the State and other States and Territories.

consignment
means a discrete quantity of plants transported to a single consignee at one (1) time covered by a single PHAC.

Department
means the NSW Department of Industry – Office of Primary Industries.

end-point inspection
means the process by which a representative sample is drawn and inspected from the consignment prior to certification.

facility
means a location where produce is assembled, inspected, securely stored, certified and dispatched, and where certification operations covered by the ICA arrangement are conducted.

host produce
means stonefruit, blueberries, persimmons and pome fruit.

in-line inspection
means the process by which a representative sample is drawn during the processing and packaging of the goods.

ICA Scheme
means a scheme developed by the States and Territories to meet their respective plant quarantine requirements under the Memorandum of Understanding on Interstate Certification Assurance dated 6 August 1999.

lot
means a quantity of homogenous product assembled for inspection at one (1) place and at one (1) time. A lot could consist of product from one or more growers/blocks/properties.

lot identification
means any coding or marking method used to identify a lot (for example, date, date code or block code).

non-conformance
means a failure to fulfil a specified requirement.

package
means the complete outer covering or container used to transport and market the product.
packed product means host produce in packages following grading and packing and ready for marketing.

persimmon means commercially produced fruit from the species Diospyros kaki.

PHAC means a Plant Health Assurance Certificate that is issued in accordance with the requirements of a Certification Assurance Arrangement.

Pome fruit means all commercially produced fruits from the Maloideae subfamily and includes apple, pear and quince.

property means one (1) or more contiguous parcels of land (lots on plan), owned or leased by a Business, that are managed as a unit and isolated from any other parcel of land owned or leased by the same Business.

Queensland fruit fly (QFF) means the pest Bactrocera tryoni (Froggatt).

SDS means Safety Data Sheet, a procedure for handling or working with chemicals in a safe manner and includes information such as physical data, toxicity, health effects, first aid, reactivity, storage, disposal, protective equipment and spill-handling procedures.

source block means a block on which produce is grown and pre-harvest treated and is the source of produce certified under this arrangement.

stonefruit means as defined in Codex Alimentarius and includes fresh fruit of apricot, cherry, nectarine, peach and plum.

5. RESPONSIBILITY

Position titles have been created to reflect the responsibilities which must be met by the Business under the ICA arrangement. These positions must be assigned to trained staff. One person may carry out the responsibilities of more than one position.

The Certification Controller is responsible for:

- representing the Business during audits and other matters relevant to the ICA Procedure;
- training staff in their duties and responsibilities under this ICA Procedure;
- ensuring the Business and staff comply with their responsibilities and duties;
- ensuring all certification of host produce is carried out in accordance with this Procedure;

UNDER PART A

- Ensuring the Business has current accreditation for an ICA arrangement under PART A of this Procedure;
- maintaining a Property Plan for each property on which the host produce is to be grown for certification under this Procedure;
- ensuring all source blocks of host produce to be harvested have undergone pre-harvest treatment as per this Procedure;
- ensuring treated produce is identified and segregated from untreated produce to avoid mixing;
- instigating action following detection of suspected live QFF infestation at harvest; and
- ensuring a PHAC is completed.

UNDER PART B

- Ensuring the Business has current accreditation for an ICA arrangement under PART B of this Procedure;
ensuring all host produce received for post-harvest packing and inspection and certification under PART B of this Procedure are sourced from a Business accredited under PART A of this Procedure and are accompanied by a valid PHAC;

ensuring treated and untreated produce are identified and controlled to prevent mixing during grading and packaging; and

taking corrective action following detection of a QFF infestation during grading and packing or packed product inspection.

The **Treatment Operator** is responsible for:

- reading the label and/or Permit, and MSDS for the chemical product in use;
- preparing and applying pre-harvest chemical treatments to all source blocks certified under this Procedure;
- conducting pre-harvest spray application calibration tests on pre-harvest treatment equipment;
- maintaining pre-harvest spray application calibration test records;
- maintaining pre-harvest spray equipment; and
- maintaining pre-harvest spray mixture preparation and treatment records.

The **Harvest Supervisor** is responsible for:

- undertaking produce inspection;
- all harvest activities, including identification of treated and untreated blocks and produce;
- advising of any infestations found and segregating infested produce;
- maintaining 'Harvest Inspection Records'; and
- completion of PHAC.

The **Produce Receival Officer** is responsible for:

- ensuring all host produce received for grading, packing and certification under PART B of this Procedure are sourced from a Business accredited under PART A of this Procedure; and
- ensuring all host produce grown by another Business is accompanied by a completed PHAC.

The **Grader/Packer** is responsible for:

- ensuring all host produce packed for certification under PART B of this Procedure is free from visible symptoms of QFF infestation; and
- ensuring all non-conforming host produce is identified and controlled to prevent mixing with conforming produce.

The **Packed Product Controller** is responsible for:

- sampling and inspecting for freedom from visible symptoms of QFF infestation;
- identifying all sample packages;
- taking corrective action following the identification of non-conforming host produce in any sample package; and
- maintaining records of packed produce inspection.

The **Authorised Signatory** is responsible for:

- signing and issuing the PHAC; and
- ensuring that the product certified under the PHAC has been completed in accordance with this ICA Procedure and that the details on the PHAC or declaration are true and correct in every particular.

The **Authorised Dispatcher** is responsible for:
ensuring all packages covered by a PHAC issued by the Business are identified; and
maintaining duplicate copies of all PHACs issued by the Business under the Procedure.

6. REQUIREMENTS

Pesticides Act 1999

There may be additional requirements, including records which must be kept, that a Business must meet under the Pesticides Regulation 2009 of the Pesticides Act 1999 that are not specified in this ICA Procedure.

Host produce certified under this ICA Procedure must comply with the following:

All source plants on the property must be treated with a pre-harvest cover spray for stonefruit, persimmons and pome fruit:

(a) with a product containing 500 g/L Trichlorfon as the only active constituent; and
   (i) applied at intervals of seven (7) to 10 days; and
   (ii) commencing at least 28 days prior to harvest; and
   (iii) in accordance with all label or APVMA Permit requirements, or

(b) with a Maldison mixture applied in high volume application containing either;
   (i) 140 mL of 440 g/L product per 100 L water; or
   (ii) 60 mL of 1000 g/L per 100 L water; or
   (iii) 55 mL of 1150 g/L per 100 L water; and
   (iv) at a maximum of three (3) applications per season; and
   (v) applied at intervals of every three (3) to seven (7) days; and
   (vi) commencing at least 28 days prior to harvest; and
   (vii) in accordance with all label or APVMA Permit requirements; or

(c) with a product containing 500 g/L Clothianidin as the only active constituent; and
   (i) 40 g product per 100 L water; and
   (ii) organosilicone surfactant at 50 mL/100 L water; and
   (iii) applied at a maximum of two (2) applications per season; and
   (iv) at intervals of every seven (7) to 10 days; and
   (v) in accordance with all label or APVMA Permit requirements; or

(d) a combination of Trichlorfon, Maldison and Clothianidin applied in accordance with all the requirements of (a), (b) and (c) above.

Blueberries

All source plants on the property must be treated with a pre-harvest cover spray for blueberries:

(e) with a product containing 75 mL of concentrate containing 400 g/L Dimethoate per 100 L spray mix or 750 mL/ha; and
   (i) make at least one (1) application before harvest and continue until the end of harvest; and
   (ii) a maximum number of seven (7) sprays can be applied per crop with a minimum 21 day and a maximum 25 day interval between application in accordance with all label or APVMA Permit requirements; or

(f) with a product containing 500 g/L Trichlorfon as the only active constituent; and
   (i) applied at intervals of seven (7) to 10 days; and
(ii) commencing at least 28 days prior to harvest; and
(iii) in accordance with all label or APVMA Permit requirements, or

(g) with a Maldison mixture applied in high volume application containing either;
   (i) 140 mL of 440 g/L product per 100 L water; or
   (ii) 60 mL of 1000 g/L per 100 L water; or
   (iii) 55 mL of 1150 g/L per 100 L water; and
   (iv) at a maximum of three (3) applications per season; and
   (v) applied at intervals of every three (3) to seven (7) days; and
   (vi) commencing at least 28 days prior to harvest; and
   (vii) in accordance with all label or APVMA Permit requirements; or

(h) a combination of Dimethoate, Trichlorfon, and Maldison applied in accordance with all the requirements of (e), (f) and (g) above;

and

(i) post-harvest inspected and found free of QFF infestation; and

(j) post-harvest inspected for broken skins (stonefruit only.)

The Business must use products in accordance with the instructions included on the product’s approved Permit and label, including any first aid, safety, protection, and storage and disposal directions.

Some produce may be damaged by chemical treatments. Businesses applying chemical treatments should check with experienced persons for any available information. Testing of small quantities is recommended.

Following the treatment requirements in this Procedure does not absolve the Business from the responsibility of ensuring that any pesticide run-off is fully contained and managed within the property.

The Department maintains the right to inspect, at any time, certified produce and to refuse to accept a PHAC where the host produce is found not to conform to specified requirements.

7. **PROCEDURE – PART A**

Part A – Covers grower activities.

7.1 **Property Plan**

A Property Plan must be provided with the application for accreditation of a Business for each block/land holding on which the host produce is grown and pre-harvest treated (see Attachment 2 – ‘Property Plan’) for certification under this Procedure.

The Property Plan must include the following:

(a) location of all the blocks on which the host produce is grown; and
(b) Block Reference Code or Number used to identify each block; and
(c) the type of host produce grown on each block; and
(d) variety and number of host produce trees planted in the block; and
(e) road access including street name/s; and
(f) internal roadways within the property; and
(g) location and identification of buildings (for example, house, packing shed, equipment sheds); and
(h) whether it is intended to certify host produce harvested from the block under the ICA arrangement.

If any changes occur to the Property Plan information, a new Property Plan must be submitted to the Certification Assurance Records Officer.

7.2 Treatment – pre-harvest cover spray

All host produce certified under this Procedure must have been pre-harvest treated for fruit fly with an approved program of cover sprays.

7.2.1 Spray equipment calibration and maintenance

The Treatment Operator must carry out:

(a) calibration tests on spray equipment to determine the application rate prior to commencement of the harvest season each year and within four (4) weeks of commencement of treatment; and

(b) regular checks of spray equipment to ensure it continues to operate effectively and remains free from malfunction, blockages, damage or excessive wear.

7.2.2 Pre-harvest spray application calibration records

Records of spray equipment calibration tests must be maintained by the Treatment Operator. The 'Equipment Application Calibration Test Record' (Attachment 3) shall identify the:

(a) name of the person conducting the test;
(b) date of testing;
(c) number of nozzles;
(d) output for individual nozzles (L/minute/nozzle);
(e) effective spray width (metres);
(f) calibration run (metres);
(g) litres used in run (L/run); and
(h) application rate (L/ha).

Results of testing must include the full calculations used to determine the application rate of the spray equipment.

7.2.3 Cover spray mixture preparation

The Treatment Operator must prepare the chemical mixture at least daily or more frequently as required.

Using a clean graduate measuring vessel, measure the amount of concentrate required for the required volume of mixture. Suitable measuring vessels include graduate plastic or glass measuring cylinders.

Add the required amount of concentrate to the spray tank in accordance with the manufacturer’s directions on the label. Fill the spray supply tank with clean water to the incremental volume mark or maximum mixture level mark.

Ensure that the chemical is completely diluted in all of the water by mixing the tank for a minimum of two (2) minutes before commencing the spray operation. Some equipment may require extended periods of mixing to fully dilute the chemical in the water.

Spray equipment must have a means of continuous mixing of the spray mixture in the spray tank throughout the spray operation to avoid settling or separation on the concentrate. This can be achieved by mechanical mixing devices in the spray tank, or agitation from spray mixture returned via a by-pass from the spray pump.
The spray mixture may contain a fungicide or other chemical provided it is approved for use and known to be compatible with the concentrate used.

7.2.4 Cover spray preparation and treatment records

The Treatment Operator must record details of all cover spray mixture preparation and pre-harvest treatment using a ‘Preparation and Treatment Record’ (see Attachment 4).

The cover spray mixture ‘Preparation and Treatment Record’ must identify:
(a) the name and Interstate Produce (IP) number of the accredited Business; and
(b) the date and time of cover spray mixture preparation and application; and
(c) volume/weight of concentrate used (millilitres or g) in the spray mixture; and
(d) the total volume (litres) of the made up spray mixture; and
(e) the trade name of the concentrate used; and
(f) any other pesticide or additives in the spray mixture (adjuvant); and
(g) calibration test record (Yes/No); and
(h) treatment equipment used; and
(i) type of host produce; and
(j) the number of blocks treated; and
(k) the identification of the Treatment Operator.

7.2.5 Cover spray application

The Treatment Operator must ensure that the spray mixture is applied with sufficient volume, and in a manner that provides sufficient penetration and distribution to ensure thorough coverage of all host produce.

Pre-harvest cover sprays must be reapplied if rain, sufficient to cause run-off, occurs within two (2) hours of spraying.

Produce from treated blocks should not be harvested until the specified withholding period has been complied with after the cover spray application.

7.3 Harvesting

The Certification Controller must oversee the harvest process to ensure only treated produce is harvested for certification under this Procedure.

7.3.1 Identification of blocks of produce

A Business with blocks of treated and untreated produce must identify the treatment status of blocks to prevent mixing of treated and untreated produce.

Example of acceptable methods of identifying treated and untreated blocks include:
(a) signs indicating both treated and untreated blocks; or
(b) colour markers indicating treated and untreated blocks.

Other methods may be used provided they clearly identify treated and untreated blocks and are acceptable to the auditor.

7.3.2 Identification of treated and untreated produce at harvest

A Business that maintains treated and untreated blocks of host produce must identify the treatment status of harvested produce to prevent mixing of treated and untreated produce.

Examples of acceptable methods of identifying treated and untreated produce include:
(a) using picking bins / crates which differ in colour for treated and untreated produce; or  
(b) using picking bins / crates which differ significantly in appearance for treated and untreated produce.  

Other methods may be used provided they clearly identify treated and untreated produce at harvest and are acceptable to the auditor.

7.4 Harvest inspection

Harvest inspection must be completed prior to the completion of a PHAC and delivery to the packer (see Attachment 10).

7.4.1 Inspection equipment

The Business must maintain the following inspection equipment:

(a) adequate illumination; and  
(b) a hand lens, microscope or other device that provides at least X10 magnification; and  
(c) reference illustrations and photographs for identification of QFF and symptoms of QFF infestations (see Attachment 5 – ‘Inspection for Queensland Fruit Fly information sheet’); and  
(d) sealable plastic bags and labels for collecting specimens of infested produce; and  
(e) pocket knife or similar to cut produce to further investigate for the presence of QFF.

7.4.2 Inspection procedure

Pickers shall remain alert for evidence of QFF infestation in treated produce harvested for certification under this Procedure. Any produce showing symptoms of QFF infestation (i.e., softened areas, spotted areas, weeping or showing bruising or breakdown) must be rejected and retained in suitably marked reject bins or other receptacles for inspection by the Harvest Supervisor.

The Harvest Supervisor must complete the inspection of host produce as follows:

(a) Rejected produce shall be broken open to expose the flesh and examined by the Harvest Supervisor for the presence of live QFF infestation. Symptoms of QFF infestation (see Attachment 5 – ‘Inspection for Queensland Fruit Fly information sheet’) include:

(i) split, discoloured, deformed, blemished or deteriorating produce; or  
(ii) characteristic QFF ‘sting marks’ that appear to be pin pricks. Sting marks are a puncture mark caused when a female QFF punctures the skin with its ovipositor and positions eggs within the host produce. Once the eggs hatch the larvae burrow towards the centre of the host produce; or  
(iii) softness under the skin. Cut the symptomatic produce in half. Larvae may be found, or the host produce will appear discoloured in the centre and the flesh will have begun to turn brown and mushy at sites where larvae are present; or  
(iv) mature QFF larvae are creamy white and up to 9 mm long, with a slightly conical shaped body and 11 segments. When examined under a hand lens the thin head has small black mouth parts. There are three (3) pairs of spiracles (small raised structures used for breathing) grouped together at the thick end of the larvae. When disturbed, and especially if exposed to sunlight, they can draw their body in to an ‘n’ shape and ‘flick’ themselves up to 10 cm in any direction. This is a dispersal mechanism of the mature QFF larvae and is diagnostic for the species.

The Harvest Supervisor must immediately advise the Certification Controller on detection of live QFF larvae.

7.4.3 Harvest inspection records

The Harvest Supervisor must maintain a record of harvest inspection of host produce. Harvest inspection records shall be in the form of a Harvest Inspection Record (see Attachment 6 – Harvest Inspection Record) or records which capture the same information.
Harvest inspection records must include:

(a) the date of inspection; and
(b) the Interstate Produce (IP) number of the Business that grew and pre-harvest treated the host produce; and
(c) the block/s from which the host produce was harvested; and
(d) the number of bins/crates harvested; and
(e) the number of host produce cut and examined; and
(f) the presence or absence of QFF; and
(g) the Harvest Supervisor’s name and signature.

7.4.4 Detection of non-conforming host produce at harvest

Where produce has been inspected and is suspected of being infested with QFF, the Certification Controller must take the following actions:

(a) all host produce harvested from the source block, must be segregated, clearly identified and held under secure conditions within the pack house to avoid mixing with non-conforming produce; and
(b) all host produce from the source block (including any produce which has already been packed for certification) must not be certified or consigned under this ICA Procedure; and
(c) the detection must be reported to the Department within 24 hours (during business hours) or the first available working day, so an investigation of the cause may be carried out and any problems rectified; and
(d) no produce from the source property may be certified under the Procedure until the Department has confirmed the identity of the larvae.

7.4.5 Rejected produce

Rejected produce may be:

(a) treated and certified in accordance with an alternative quarantine entry condition; or
(b) consigned to markets that do not require certification of treatment and/or inspection for QFF.

7.5 Plant Health Assurance Certificate

A Business which pre-harvest treats produce that is to be packed and certified by another Business must be accredited under PART A of this Procedure.

Businesses who supply host produce to be packed by another Business for certification must supply a PHAC (Attachment 10) with each delivery of host produce.

The Harvest Supervisor must ensure a PHAC is completed and signed by an Authorised Signatory prior to the consignment being dispatched.

PHACs must be completed, issued and distributed in accordance with the Work Instruction WI-01 Guidelines for the completion of Plant Health Assurance Certificates.

PHACs must include:

(a) in the ‘Accredited Business that Prepared the Produce’ section, the name and address of the Accredited Business that packed and inspected the host produce; and
(b) in the ‘Grower’ section, the name and address of the property on which the host produce was grown, pre-harvest monitored and harvest inspected; and
(c) in the ‘Consignment Details’ section,
   (i) the number and type of packages in the consignment; and
   (ii) in the ‘Type of Produce’ column, a description of the host produce; and
(d) in the ‘Treatment Details’ section, the details of the last pre-harvest treatment applied to the source block or blocks in which the host produce was grown; and

(e) in the ‘Additional Certification’ section the statement “inspected during harvest and found free of live QFF”; and

(f) additional detail for Tasmania only: In the ‘Additional Certification’ section, the statement “handled, stored and transported in secure conditions”.

The Business must not issue a PHAC for host produce owned by another Business. An individual PHAC must be issued to cover each consignment to avoid splitting of consignments.

Books of pre-printed PHACs are available from ICA Records Management, Department of Primary Industries, phone 02 6552 3000. Upon suspension, cancellation or withdrawal of accreditation, the PHAC book must be immediately returned to the Department.

A PHAC is not required where the Business that grows and pre-harvest treats and inspects the host produce is the same Business that packs, inspects, certifies and dispatches the host produce under this Procedure.

8. PROCEDURE – PART B

Part B – Covers the packer activities of produce receival, grading and packing, post-harvest inspection and certification.

8.1 Receival of Produce

The Produce Receival Officer must ensure the following:

(a) All host produce received for certification under this Procedure is supplied by a grower accredited under Part A; and

(b) where the Business receives treated and untreated produce, the treatment status of the host produce is clearly identified at receival by the packing facility to prevent mixing of treated and untreated produce; and

(c) each delivery of host produce supplied by another Business is accompanied by a PHAC (see Attachment 10). A PHAC is required for each day for each lot of host produce supplied for certification under this Procedure; and

(d) produce supplied for certification has undergone pre-harvest treatment in accordance with Part A of this Procedure; and

(e) grower identification and pre-harvest treatment details are maintained for all host produce received and certified under this Procedure; and

(f) produce is segregated or secured upon arrival to ensure produce does not mix with untreated produce; and

(g) a ‘Record of Receipt’ (see Attachment 7), or similar record which captures the same information, is maintained by the Business. The record must include the following information:

(i) the name and Interstate Produce (IP) number of the accredited Business that grew and pre-harvest treated the host produce; and

(ii) the record number; and

(iii) PHAC numbers; and

(iv) date of receipt; and

(v) produce type; and

(vi) quantity; and

(vii) Produce Receival Officer name and signature.

Any produce received that is not clearly identified as treated must be regarded as non-treated, and rejected and managed as untreated produce for the purpose of this Procedure.
The Business must maintain copies of all PHACs received from growers whose produce is packed and certified under this Procedure.

8.2 Grading and packing

The Certification Controller must supervise the sorting and packing operations to ensure that any host produce that do not conform to these requirements are clearly identified and segregated to prevent mixing with conforming product.

The Business must implement sorting systems during the grading and packing process to ensure all host produce certified for pre-harvest treatment and inspection is free from visible symptoms of QFF infestation.

8.2.1 Identification during grading and packing

Where both treated and untreated produce are packed, the Business must implement systems to identify the treatment status of host produce during grading and packing to prevent mixing of treated and untreated produce.

Example of acceptable methods of identifying treated and untreated produce during grading and packing include:

- packing treated produce at different times to untreated produce and clearing the lines before changing over; or
- packing treated and untreated produce on different packing lines.

Other methods may be used provided they clearly identify and segregate treated and untreated produce and are acceptable to the auditor.

8.2.2 Identification after packing

A Business which grades and packs treated and untreated produce must implement systems to identify the treatment status of the host produce after packing and before they leave the packing system to prevent mixing of treated and untreated produce.

Examples of acceptable methods of identifying treated and untreated produce after packing include:

- using packaging which differs significantly in appearance; or
- marking each package of treated produce in a manner that clearly identifies the host produce as treated in accordance with this Procedure.

Other methods may be used provided they clearly identify treated and untreated produce and are acceptable to the auditor.

8.3 Packed product inspection

Samples must be selected at random from packed product as an in-line inspection or end-point inspection.

The Packed Product Controller must continually monitor the grading and packing process by selecting a sample for examination from the packed product.

The Packed Product Controller must advise the Certification Controller of any problems or potential problems detected in these samples (for example, contain suspect QFF eggs or larvae) so that corrective action can be implemented.

8.3.1 Sample selection

The Packed Product Controller must select a minimum of one (1) package in every 50 packages or part thereof.

(a) In-line inspection:
   (i) in-line inspection must only be carried out by the Business that packs the host produce for certification under this Procedure; and
(ii) in-line inspection must be performed at facilities where the host produce is being packed; and

(iii) the in-line inspection method is only available at the first point of packing the host produce; or

(iv) the in-line inspection must involve the selection of a sample of packed product from all host produce in the same category of host produce, packed on the one (1) day for certification under this Procedure; and

(v) packed produce must be selected at random from the final packed product as it leaves the packing line in the packing shed for consolidation.

or

(b) End-point inspection:

(i) end-point inspection must be conducted after the consignment has been consolidated but prior to certification and dispatch; and

(ii) the sample must be selected at random from the final packed product.

8.3.2 Inspection equipment

The Business must maintain the following inspection equipment:

(a) adequate illumination; and

(b) a hand lens, microscope or other device that provides at least X10 magnification; and

(c) reference illustrations and photographs for identification of QFF and symptoms of QFF infestations (see Attachment 5 – ‘Inspection for Queensland Fruit Fly information sheet’); and

(d) sealable plastic bags and labels for collecting specimens of infested produce; and

(e) pocket knife or similar to cut produce to further investigate for the presence of QFF.

8.3.3 Inspection procedure

The Packed Product Controller must carry out 100% inspection of the host produce as follows:

(a) each piece of host produce in the sample package must be removed from the package and all surfaces examined for evidence of QFF and broken skins. Symptoms of QFF infestation (see Attachment 5) include:

   (i) split, discoloured, deformed, blemished or deteriorating produce; or

   (ii) characteristic QFF ‘sting marks’ that appear to be pin pricks. Sting marks are a puncture mark caused when a female QFF punctures the skin with its ovipositor and positions eggs within the host produce. Once the eggs hatch the larvae burrow towards the centre of the host produce; or

   (iii) softness under the skin. Cut the symptomatic produce in half. Larvae may be found, or the host produce will appear discoloured in the centre and the flesh will have begun to turn brown and mushy at sites where larvae are present; or

   (iv) mature QFF larvae are creamy white and up to 9 mm long, with a slightly conical shaped body and 11 segments. When examined under a hand lens the thin head has small black mouth parts. There are three (3) pairs of spiracles (small raised structures used for breathing) grouped together at the thick end of the larvae. When disturbed, and especially if exposed to sunlight, they can draw their body in to an ‘n’ shape and ‘flick’ themselves up to 10 cm in any direction. This is a dispersal mechanism of the mature QFF larvae and is diagnostic for the species; or

   (v) (for stonefruit only) broken skin includes any crack, split, puncture or other break of the skin that penetrates through to the flesh that occurred prior to grading and packing.
8.3.4 Identification of sample packages
Sample packages must be sequentially numbered during the day of packing.

(a) Identify each sample package with a Packed Product Sample (PPS) number by placing either a stamp or sticker bearing the lettering “PPS No.” on the exposed end of the package, then marking on or below the identifier the sequential sample number and their initials (see Attachment 8 – ‘Example of a Packed Product Sample Number”).

(b) For palletised consignments, the sample packages must be stacked on the pallet with the “PPS No.” visible on the outside of each pallet packed for certification under this Procedure.

8.3.5 Action following detection of non-conforming packed product
The Packed Product Controller must take the following actions on the detection of non-conforming packed product.

8.3.5.1 Detection of live QFF larvae
If live QFF Larvae are detected, the Packed Product Controller must immediately advise the Certification Controller if any produce is found infested with live QFF.

The Certification Controller must take the following actions:

(a) all host produce harvested from the source block/s, including any produce which has been packed for certification but which remains on the premises, must be rejected for certification under this Procedure; and

(b) the detection must be reported to the Department within 24 working hours of detection, (during business hours) or the first available working day, so an investigation of the cause may be carried out and any problems rectified.

8.3.5.2 Detection of produce with broken skin
If any sample package contains produce with broken skin, the Packed Product Controller must:

In-line inspection:

(a) reject the sample package; and

(b) withdraw and isolate all product packed since the previous sample package was selected; and

(c) stop the packing line; and

(d) note in the “Comments” section of the ‘Packed Product Inspection Record’ (see Attachment 9) next to the entry for the sample package which failed inspection, the reason for failure and the number of withdrawn packages.

(e) following resumption of grading and packing, the Packed Product Controller must:

(i) select an additional three (3) sample packages from the withdrawn packages; and

(ii) carry out 100% inspection of the host produce in the additional sample packages for conformance with the requirements specified in Section 6; and

(iii) give additional sample packages the next three (3) Packed Product Sample (PPS) numbers after the package that initially failed inspection. The inspection results must be entered on the ‘Packed Product Inspection Record’.

(f) If all three (3) additional sample packages are found to conform, the withdrawn packages and the three (3) sample packages may be passed for certification and returned to the product assembly point.

(g) If any of the additional sample packages contain non-conforming host produce, all withdrawn packages shall be rejected.

(h) Once any problems have been identified and rectified, grading and packing may recommence.

End-point Inspection:

(a) reject the entire consignment; and
(b) note in the “Comments” section of the ‘Packed Product Inspection Record’ next to the entry for any sample package which failed the inspection, the reason for failure and the number of packages in the rejected consignment.

8.3.6 Rejected product
All rejected packages must be isolated and clearly identified to prevent mixing with conforming packages.

Packages rejected for live QFF larvae must be either:
(a) certified in accordance with an alternative quarantine entry condition; or
(b) consigned to markets that do not require certification of treatment and/or inspection for QFF.

Packages rejected for broken skins (stonefruit only) must be either:
(a) re-graded, re-packed and re-inspected in accordance with this section prior to certification under this Procedure; or
(b) treated and certified in accordance with an alternative quarantine entry condition; or
(c) consigned to markets that do not require certification of treatment and/or inspection of QFF.

8.3.7 Packed Product Inspection Records
The Packed Product Controller must maintain records of the results of packed product inspection.

Packed product inspection records must be in the form of a ‘Packed Product Inspection Record’ (see Attachment 9), or a similar record which captures the same information.

‘Packed Product Inspection Records’ must include:
(a) Business name; and
(b) type of host produce; and
(c) the Interstate Produce (IP) number of the Business that operates the approved facility in which the host produce was packed; and
(d) the date of inspection of the sample package; and
(e) PHAC number; and
(f) the sample package sequential number (PPS No.); and
(g) the inspection result for the sample package; and
(h) details of defects or problems detected during inspection; and
(i) the number of any withdrawn or rejected packages; and
(j) the inspection results and follow-up action by the Certification Controller following withdrawal; and
(k) the Packed Product Controller’s name and signature.

8.4 Dispatch

8.4.1 Package identification
The Authorised Dispatcher must ensure that, prior to issuing a PHAC, each package intended for certification under this Procedure is marked in indelible and legible characters of at least 5 mm with:
(a) the Interstate (IP) number of the Business that operates the approved facility in which the host produce was packed; and
(b) the words “Meets ICA-21”; and
(c) the date (or date code) on which the host produce was packed; and
(d) the Interstate Produce number or other identifier of the grower of the host produce, where the grower is a different Business to the packer.

Where the packer uses a different identifier to the IP number of the grower, the packer must maintain a Grower Identifier Record that matches the grower identifier with the grower’s names or IP number so that the grower can be easily identified if required.

Any packages containing produce that has not been pre-harvest treated and inspected in accordance with the requirements of this Procedure must not be marked as stated above.

8.4.2 Plant Health Assurance Certificate (PHAC)

The Authorised Dispatcher must ensure a PHAC (see Attachment 10) is completed and signed by an Authorised Signatory prior to the consignment being dispatched.

PHACs must be completed, issued and distributed in accordance with the work instruction WI-01 ‘Guidelines for the completion of Plant Health Assurance Certificates’.

PHACs must include:

(a) in the ‘Accredited Business that Prepared the Produce’ section, the name and address of the Accredited Business that packed the product; and
(b) in the ‘Grower’ section, the name and address of the Accredited Business that was responsible for pre-harvest treatment of the host produce. Where the consignment contains produce pre-harvest treated by a number of growers the words “VARIOUS” must be used; and
(c) in the “Additional Certification” section “Inspected and found free of QFF larvae and broken skins” must be written.

The Business must not issue a PHAC for product owned by another business. An individual PHAC must be issued to cover each consignment to avoid splitting of consignments.

Books of pre-printed PHACs are available from ICA Records Management, Department of Primary Industries, phone 02 6552 3000. Upon suspension, cancellation or withdrawal of accreditation, the PHAC book must be immediately returned to the Department.

8.4.3 PHAC distribution

The original (yellow copy) must accompany the consignment.

The duplicate (white copy) must be retained by the accredited Business.

9. RECORDS AND DOCUMENT CONTROL

9.1 ICA system records

The Business must maintain the following records, or similar which record the same information:

Under PART A

(a) current ‘Property Plan’ for each block/source property (Attachment 2); and
(b) ‘Equipment Application Calibration Test Record’ (Attachment 3); and
(c) ‘Preparation and Treatment Record’ (Attachment 4); and
(d) ‘Harvest Inspection Record’ (Attachment 6); and
(e) a copy of each PHAC issued under this Procedure. (Attachment 10)

Under PART B

(a) a copy of each PHAC received (Attachment 10); and
(b) ‘Record of Receipt’ (Attachment 7); and
(c) ‘Packed Product Inspection Record’ (Attachment 9); and
(d) a copy of each PHAC issued under this Procedure.
Records must be retained for 4 years from completion.
Records shall be made available on request to an Authorised Person.

9.2 ICA system documentation

The Business must maintain the following documentation:
(a) a current copy of the Procedure; and
(b) a current Certificate of Accreditation.
Documentation must be made available on request to an Authorised Person.

10. ATTACHMENTS

Attachment 1 Application for Accreditation as a Biosecurity Certifier
Attachment 2 Property Plan
Attachment 3 Equipment Application Calibration Test Record
Attachment 4 Preparation and Treatment Record
Attachment 5 Inspection for Queensland fruit fly Information Sheet
Attachment 6 Harvest Inspection Record
Attachment 7 Record of Receipt
Attachment 8 Example of a Packed Product Sample Number
Attachment 9 Packed Product Inspection Record
Attachment 10 Plant Health Assurance Certificate
Application for accreditation as a Biosecurity Certifier

A business seeking to become accredited or renew accreditation for an ICA or CA arrangement must complete and lodge an application for accreditation using the prescribed form and paying the application fee.

The application form can be accessed at:

Alternatively, contact ICA Records Management:
Phone: 02 6552 3000
Fax: 02 6552 7239
Email: ica.scheme@dpi.nsw.gov.au
**Property Plan – ICA-21**

**Grower Name:** 

**Property Address:** 

The Property Plan is to include the following:

(a) the location of all blocks on which host produce is planted;
(b) the block reference code or number used to identify each block;
(c) the type of host produce grown on each block;
(d) the cultivar and number of trees planted in the block;
(e) road access including street name/s;
(f) internal roadways within the property;
(g) the location and identification of buildings on the property (e.g., house, packing shed, equipment sheds, etc.).
(h) whether it is intended to certify host produce harvested from the block under the ICA arrangement.

**Note:** A Property Plan (overleaf) must be included for each property covered by the Business' Interstate Certification Assurance arrangement.

Complete the following details for each block shown on the Property Plan:

<table>
<thead>
<tr>
<th>Block Reference Code or No.</th>
<th>Name Used on Farm for the Block</th>

Example of a Packed Product Sample Number

Marking Sample Packages After Packed Product Inspection

Following inspection, the Packed Product Controller must:

(a) mark one end of each sample package by applying a stamp or sticker with the PPS Number (Packed Product Sample Number) and their initials as shown below; and

(b) ensure that the PPS Number stamp or sticker is visible on the exposed end of the package when the package is assembled on the pallet.
